

## Agenda

- Rational Behind ISP Network Design
- Point of Presence Topologies
- Adding Services to the Architecture
- Impact of Services on the Network

Presentation\_ID © 1998, Cisco Systems, Inc. www.cisco.com 2

## The Free On-line Dictionary of Computing

**Architecture:** Design; the way components fit together; it may also be used for any complex system, e.g. "software architecture", "network architecture"

Presentation\_ID © 1998, Cisco Systems, Inc. www.cisco.com 4

## Network Design and Architecture...

- ... can be critical
- ... can contribute to the success of the network
- ... can contribute to the failure of the network

Presentation\_ID © 1998, Cisco Systems, Inc. www.cisco.com 5

## Ferguson's Law of Engineering

“  
**No amount of magic knobs will save a sloppily designed network**  
”

Paul Ferguson—Consulting Engineer,  
Cisco Systems

Presentation\_ID © 1998, Cisco Systems, Inc. www.cisco.com 6

## What Is a Well-Designed Network?

- One that takes into consideration some main factors
  - ✓ Topological/protocol hierarchy
  - ✓ Redundancy
  - ✓ Addressing aggregation (IGP and BGP)
  - ✓ Scaling
  - ✓ Policy implementation (core/edge)
  - ✓ Management/maintenance/operations
  - ✓ Cost

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

7

## One Must Acknowledge that...

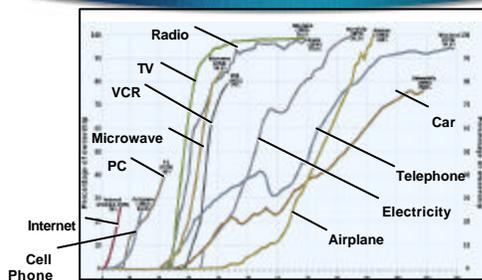

- Two different worlds exist
  - ✓ One world revolves around private organizational networks and another concerns the global Internet
- Growth in the Internet is faster than any other technology introduced to the public-at-large

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

8

## Technology Adoption

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

9

## Scaling is the #1 Problem on the Internet

“  
*If you're not scared yet,  
 you don't understand the  
 problem!*  
 ”

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

10

## Core Influences to ISP Design

- Modular Design
- Functional Design
- Tiered/Hierarchical Design
- Multiple Levels of Redundancy
- Routing Protocol Hierarchy
- Build for IP Forwarding First - then add services

Presentation\_ID © 1998, Cisco Systems, Inc.

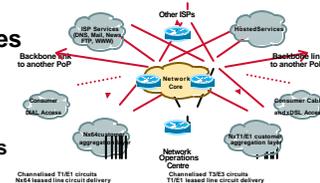

www.cisco.com

11

## Modular Design

Organize the Network into separate and repeatable modules

- ✓ Backbone
- ✓ POP
- ✓ Hosting Services
- ✓ ISP Services
- ✓ Support/NOC

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

12

## Functional Design

- **One Box cannot do everything!** (no matter how hard people have tried in the past)
- **Each router/switch in a network has a well-defined set of functions.**
- The various *boxes* each with a function interact with each other.
- **ISP Networks are a systems approach to design.**

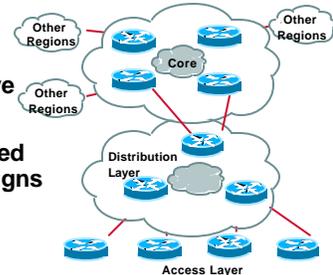

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

13

## Tiered/Hierarchical Network Design

- **Flat - Meshed Topologies have not scaled.**
- **Hierarchy is used in network designs to scale the network.**

Presentation\_ID © 1998, Cisco Systems, Inc.

14

## Multiple Levels of Redundancy

### • Triple Layered POP Redundancy

- ✓ Lower-level failures are better
- ✓ Lower-level failures may trigger higher-level failures
- ✓ L2: Two of everything at
- ✓ L3: IGP and BGP provide redundancy and load balancing
- ✓ L4: TCP re-transmissions recovers during the fail-over

Presentation\_ID © 1998, Cisco Systems, Inc.

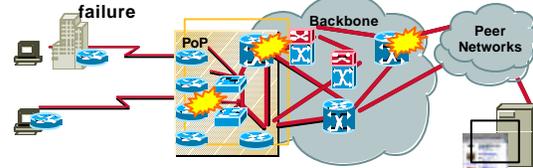

www.cisco.com

15

## Multiple Levels of Redundancy

### • Objectives -

- ✓ As little user visibility of a fault as possible
- ✓ Minimize the impact of any fault in any part of the network.
- ✓ Network needs to handle L2, L3, L4, and Router failure

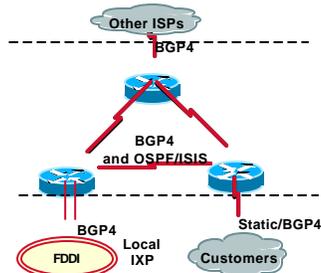

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

16

## Hierarchy of Routing Protocols

Presentation\_ID © 1998, Cisco Systems, Inc.

18

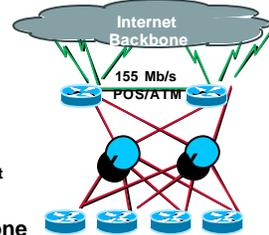

### Early Internet POP Architecture - 'NSP

- ✓ Backbone trunks at 45 Mb/s
- ✓ Shared media interconnect within POP:  
FDDI, Ethernet, Switched Ethernet
- ✓ Conventional T3 backbone Internet router

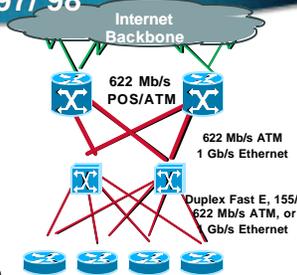

### Internet POP Architecture - '96/'97

- ✓ Backbone trunks at 155 Mb/s  
Packet over SONET OC3  
ATM OC3
- ✓ Switched interconnect within POP:  
Switched FDDI/Fast Ethernet  
ATM OC3
- ✓ Advanced OC3 backbone Internet router

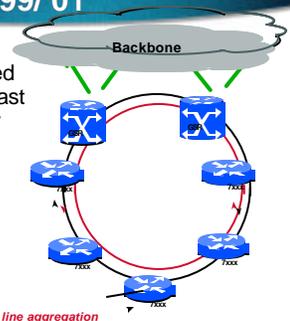

### Internet POP Architecture - '97/'98

- ✓ Backbone trunks at 622 Mb/s  
Packet over SONET OC12  
ATM OC12
- ✓ Switched interconnect within POP:  
ATM at OC3 AND OC12  
Ethernet Channel  
Gigabit Ethernet (early '98)  
POSIP (late '98)
- ✓ Gigabit OC12 backbone Internet router

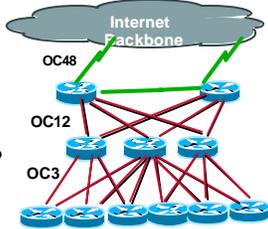

### Internet POP Architecture - '99/'01

- SRP Rings - High Speed of SDH combined with fast failover and redundancy
  - ✓ High bandwidth
  - ✓ Reduced port counts
  - ✓ Reduced complexity
  - ✓ Proactive self healing

## Large POPs - add a 3rd layer

- ✓ Problem: port density!
- ✓ Solution: buy more routers!
- ✓ Customer routers connect to aggregation routers
  - Packet over SONET OC3
  - ATM OC3
- ✓ Aggregation routers connect to backbone routers
  - OC48
  - OC12
  - OC3
- ✓ Scales nicely
- ✓ X CRs to Y ARs to Z BRs
  - ✓ ...where X>Y>Z
  - ✓ Be careful not to oversubscribe!

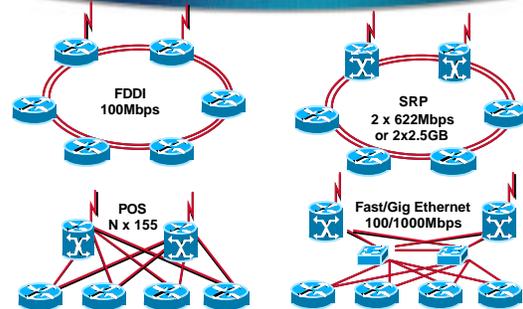

Presentation\_ID

www.cisco.com

25

## POP Interconnect Summary

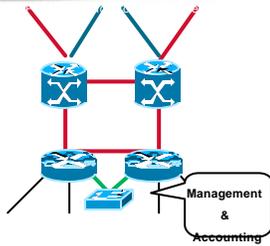

Presentation\_ID

www.cisco.com

26

## Key Design Principles

- Interconnection for Management, Security, and Accounting services
  - ✓ Netflow Devices - FlowCollector
  - ✓ Syslog collector for all network devices
  - ✓ SNMP collector (PC Based UNIX)
  - ✓ Security Auditing Tools (NetSonar)

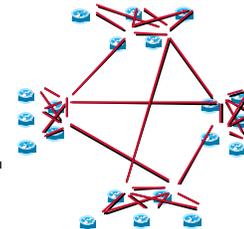

Presentation\_ID

www.cisco.com

27

## ISP routing Architectures - IP

- IGP = EIGRP, IS-IS, or OSPF
  - ✓ almost always IS-IS or OSPF
  - ✓ IS-IS, single level (usually L2)
  - ✓ OSPF, either single area or BB/POP areas
- BGP = all routers in full mesh
  - ✓ mesh accomplished with route reflectors, confederations, actual full mesh
- All routers have all routes, so services could go anywhere

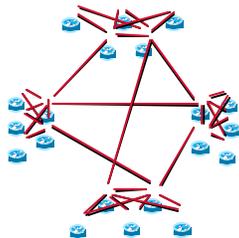

Presentation\_ID

www.cisco.com

28

## ISP routing Architectures - IP+MPLS

- IGP = EIGRP, IS-IS, or OSPF
  - ✓ must be IS-IS or OSPF to use MPLS TE
- BGP = only edge routers need full routes
  - ✓ full-mesh of edge routers using aforementioned mechanisms
  - ✓ packets are forwarded via LDP labels, not IP destination address
- Where to put your services?
  - ✓ cannot hang a cache service off of a router that doesn't have full routes!

29

## Adding Services to the Architecture Cause and Effect

1529  
0225\_0479\_c1

www.cisco.com

30

## Services? How many Services?

Most network services are applied at the edge!

- |  |   |
|--|---|
| <b>Edge (one-time) services</b>  | <b>Per-hop services</b>   |
| <ul style="list-style-type: none"><li>• Voice over IP</li><li>• MPLS VPNs</li><li>• CDNs</li><li>• VPDNs</li><li>• Managed services</li><li>• Dial—DSL—cable</li></ul> | <ul style="list-style-type: none"><li>• MPLS packet forwarding</li><li>• DiffServ, other QoS</li><li>• Multicast Services</li></ul> |

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

31

## Ask the Right Questions

- **What is the value of the service?**
  - ✓ Technical merit
  - ✓ Cost savings
  - ✓ Marchitecture
- **What is the cost of the service?**
  - ✓ Equipment?
  - ✓ Training people to support it?
  - ✓ Network buildouts/topology changes?

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

32

## Impact of Services on the Network

1998  
0925\_04P2.c1

© 1998, Cisco Systems, Inc.

www.cisco.com

33

## Who Knows?

- **What will be the impact on existing traffic loads/patterns?**
- **Can the network deliver the performance that your customers/applications desire? delay? jitter (delay variation)?**
- **Make sure to add capacity as you add services - bandwidth is a must.**

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

34

## Deployment of New Services

- **Is more of a business decision**
- **The technical aspect is to ensure continued network performance—scalability and stability**
- **Try to keep services within your AS**
  - ✓ end2end control
  - ✓ less likelihood of failure/flaps

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

35

## Deploying New Services

- **Don't feed the hype fire**
- **Look *before* you leap!**
- **Don't deploy new technologies and services just for the sake of it; have valid business and technical reasons**

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

36

## Deploying New Services

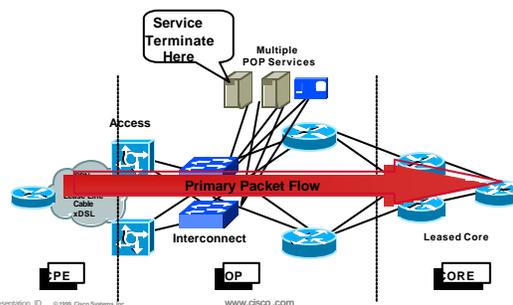

- Usually a Service requires a TCP/UDP termination (i.e. TCP's three way handshake)
- Termination should happen out side of the *primary flow path*
- Otherwise, the network is then designed around the single service.

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

37

## Deploying New Services

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

38

## Transparent Redirection of a Flow in the POP

*Factors that went into the design of WCCP*

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

39

## Design Objectives for the ISP

- Transparent *Redirection* of a IP flow based on source, destination, and/or port number.
- Transparent *Integration* - no rebuilding the POP to add this service.
- Failed open - if the service fails, it should not effect the core IP service nor any other services.

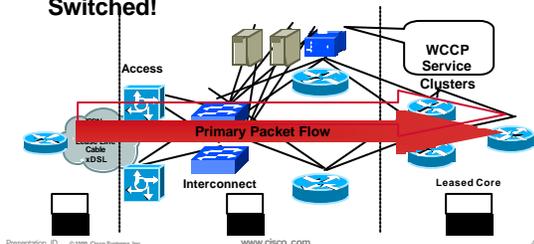

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

40

## Design Objectives for the ISP

- Not to effect the primary packet flow of the POP - if not redirected - then is CEF/dCEF Switched!

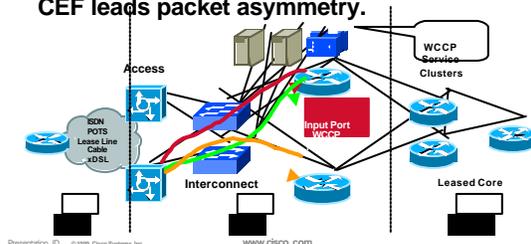

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

41

## Design Objectives for the ISP

- Work with the multi-level L2/L3 redundancy of the ISP POP. Equal paths in the IGP + CEF leads packet asymmetry.

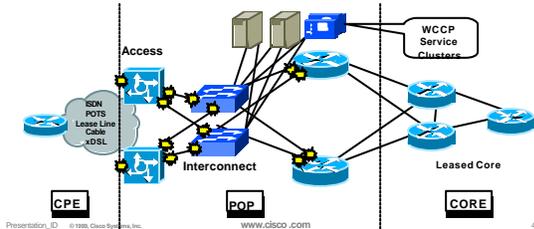

Presentation\_ID © 1998, Cisco Systems, Inc.

www.cisco.com

42

## Design Objectives for the ISP

- Provide the ISP with Flexibility on the point of redirection. Do not force an architecture on the customer.

## Design Objectives for the Service Group

- Linear Scalability with the Cache - minimize object replication.
- Fault Tolerance and Maintenance.
- “Joe Smith the Telco Tech” test.
